קורס NodeJS תשפה

נספח - Node.js + TypeScript Naming Conventions

1. Files and Folders

• File Names: Use kebab-case, all lowercase.

Example: user-service.ts, auth-controller.ts

• Folder Names: Use kebab-case, all lowercase.

Example: middlewares/, routes/, services/

2. Variables and Constants

• Local Variables: Use camelCase.

Example: userId, accessToken

• Constants: Use UPPER_SNAKE_CASE.

Example: MAX_RETRIES, DEFAULT_TIMEOUT

- Always use **const** for values that don't change.
- Use **let** for variables that are mutable.

3. Functions and Methods

Function Names: Use camelCase.

Example: getUserById(), calculateTax()

• Method Names: Use camelCase.

Example: save(), validateEmail()

4. Classes and Interfaces

Class Names: Use PascalCase.

Example: UserService, AuthController

• Interface Names: Use PascalCase, optionally prefixed with I.

Example: IUser, ICreateUserRequest

5. Types, Enums, and Generics

• Type Aliases: Use PascalCase.

Example: type Json = Record<string, any>

- Enums:
 - Use **PascalCase** for the enum name.

Example: Role

• Use **UPPER_SNAKE_CASE** for enum members.

Example: ADMIN, USER

• **Generic Type Parameters:** Use a single uppercase letter (T, U, V, etc.).

Example: function wrapInArray<T>(value: T): T[] {}

7. Other Best Practices

• Environment Variables: Use UPPER_SNAKE_CASE.

Example: DB_HOST, API_KEY

• Private Properties: Prefix with an underscore _.

Example: _isLoggedIn

• Error Classes: Class names should end with Error.

Example: ValidationError, DatabaseError

• Promises: Name promises clearly to indicate their purpose.

Example: fetchUserPromise
